

# How to Align Vertical Louvers

## VX-200 and Vistec Headrails

Take hold of the chain (2) and pull to turn louvers to a closed position. By being out of alignment, some louvers will not seem to close as tightly as others. That's okay; you are getting ready to remedy this.

1. Pull louvers to a closed position until the chain stops. Give the chain a good steady tug. It will sound as if you are stripping the gears.
2. Pull the chain to turn the louvers in the opposite direction and repeat the act of giving the chain a good steady tug. Again it will sound as the gears are being stripped.

The louvers are now aligned and will close properly.

If at any time the louvers become unaligned, you may repeat the process.
